

*The format for notification to an affected Party of a proposed activity under article 3 of the Convention was adopted by the Meeting of the Parties to the Convention on Environmental Impact Assessment in a Transboundary Context by **Decision I/4** at its first meeting held in Oslo from 18 to 20 May 1998. This document contains excerpt from Annex to Decision I/4 (Table 1) and can only be used in conjunction with the full text of Decision I/4 and not as a stand-alone document.*

**Notification to an affected Party of a proposed activity
under article 3 of the Convention**

1. INFORMATION ON THE PROPOSED ACTIVITY	
(i) Information on the nature of the proposed activity	
Type of activity proposed	Renewable energy resource activity - construction and operation of a Wind Power Plant at the location "Pyramis Vrachou" with the power of 34,5 MW.
Is the proposed activity listed in appendix I to the Convention?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
Scope of proposed activity (e.g. main activity and any/all peripheral activities requiring assessment)	<p>The main activity of the project is the construction and operation of a Wind Power Plant at the location " Pyramis Vrachou " consisting of ten (10) wind turbines of indicative type V117-3,45MW, with a power of 3,45MW each.</p> <p>The project under consideration aims to create a wind power plant to produce electricity in compliance with the legislation in force, the exploitation of the wind potential of the region and the decoupling from conventional fuels that not only increase the price of electricity but also emit polluting and harmful substances into the environment.</p> <p>Greece has a high production potential due to the prevailing climatic conditions. Due to the sunshine that prevails during most days of the year, it has a strong wind capacity (significantly exploitable wind speeds of 7-10m/s). Therefore, all this untapped production potential can be exploited and enhance the energy mix of the country and the EU in general.</p> <p>Specifically, for the wind power plant under study, it meets the requirements, in terms of wind potential, for the development of a sustainable investment, while helping to achieve the national target for RES, beneficially offsetting the small-scale impacts of its construction and operation.</p> <p>The project has been designed with environmental protection and optimal use of the available wind potential of the site in mind. The wind farm will be an independent producer of electricity and will be interconnected to the grid of the (Hellenic Electricity Distribution Network Operator) which all production will be exclusively allocated in accordance with the applicable legislation. The supply of the electricity produced by the wind farm is guaranteed through a specific contract with the RES & Guarantees of Origin Manager S.A.</p>

<p>Scale of proposed activity (e.g. size, production capacity)</p>	<p>a) The project falls under Group 10 (Renewable Energy Sources - a/a 1a: Electricity generation from onshore wind energy) and based on the Joint Ministerial Decision YPEN/DIPA/17185/1069/2022 (Government Gazette 841 B/24.2.2022) which has been amended by the Joint Ministerial Decision. YPEN/DIPA/53510/3616/2023 (Government Gazette 3327/B` 19.5.2023) is classified in Subcategory A2 (6.5 MW < P ≤ 45 MW and L < 20 km) since its total capacity is 34.5 MW.</p> <p>As the whole project falls within a Natura 2000 site, which is a Special Protection Area and has the code GR1110010 with the name Oreinos Evros – Koilada Dereiou, the maximum categorisation threshold is 35 MW (6,5 MW < P ≤ 35 MW and L < 20 km) and therefore the project under consideration remains in Subcategory A2. It is also a critical area for birds (SPA) with the code GR003 and the designation Forest of Dadia and the “Koilada Filouri”.</p> <p>b) The road network construction is associated works and follow the category of the main project and are therefore included in Subcategory A2.</p> <p>(c) The route of interconnection line are also ancillary works and follow the category of the main project and are therefore included in Subsection A2.</p>
<p>Description of proposed activity (e.g. technology used)</p>	<p>Main Project:</p> <ol style="list-style-type: none"> 1. Installation of a Wind Power Plant within a land area of total area: 430.194,38sq.m. consisting of ten (10) wind turbines, with a rotor diameter of 117m, with a power of 3,45MW each, i.e. a total power of 34,5MW. 2. Configuration of ten (10) wind turbine construction squares with a total occupied area equal to 98.038,15 m3. 3. Wind turbine foundations - construction of pylon bases with the excavation of ten foundations. 4. Construction of an internal underground medium voltage network for the transmission of electricity generated by the wind turbines to the control house (coupling house), with a total length of 4.873,69 m. 5. Construction of a control house with an area of 31.50 m2 on the site of wind turbine 3. 6. Construction of 33kV underground transmission interconnection from the control house to the 33/150KV (Medium Voltage/High Voltage) elevation Patriarchis Substation, total length 11.903,67m, of which 230,11 m overlapped by the internal network. <p>Accompanying works:</p> <ol style="list-style-type: none"> 1. Construction of roads for access to the project site and internal road connections of the wind turbines of the "Pyramis Vrachou" wind farm, consisting of forest roads of category C with a total length of 6.031,65 m, of which 2.487,28 m are new roads and 3.544,37 m are improvements to existing roads. 2. Construction of storm water drainage works.
<p>Description of purpose of proposed activity</p>	<p>The project under consideration aims at the construction and operation of a Renewable Energy Sources project and specifically a wind power plant to produce wind energy, in compliance with the legislation in force, the exploitation of the wind potential of the region and the decoupling from conventional fuels that not only increase the price of electricity but also emit polluting and harmful substances into the environment.</p> <p>Renewable energy sources are known as soft forms of energy because their use does not require any energy input (e.g. combustion), as they use a form of energy</p>

	generated by natural processes. They have been used since ancient times to meet energy needs and, unlike fossil fuels, are inexhaustible. Renewable energy sources have a zero-energy footprint. The energy footprint is the amount of carbon dioxide (CO ₂) emitted into the atmosphere.
Rationale for proposed activity (e.g. socio-economic basis, physical geographic basis)	<p>The proposed activity belongs to the Wind Priority Areas (PAP) ¹ according to the Joint Ministerial Decision 49828/2008/Government Gazette 2464/3.12.2008 «Special Spatial Planning Framework for Renewable Energy Resources (RES)».</p> <p>On the basis of the spatial plan, the wind turbines were examined with regard to their compatibility according to Article 7 of the EIA (Special criteria for the siting of wind turbines on the mainland).</p> <p>The main advantages of renewable energy sources are summarized below:</p> <ul style="list-style-type: none"> • They are inexhaustible sources of energy and help to reduce countries' dependence on depletable energy resources, giving countries the ability to: • To improve their energy independence • To strengthen their trade balance by reducing energy imports. • To create strategic reserves in domestic mineral resources for the security of the country and future generations. • They lead to decentralization of the energy system, due to their geographical dispersion, resulting in the ability to meet energy needs at the local and regional level and the consequent relief of infrastructure systems and limiting losses from energy transmission. • They have relatively low operating costs independent of fluctuations in the international economy and in particular in the price of conventional fuels. • They offer the possibility of rational use of energy resources, covering a wide range of users' energy needs. • Contribute to the regeneration of economically and socially deprived areas by creating new jobs and attracting investment. • They are environmentally and human friendly.
Additional information/comments	
(ii) Information on the spatial and temporal boundaries of the proposed activity	
Location	The proposed activity falls within the Municipal Unit of Orpheus, the Municipality of Soufli, the Regional Unit of Evros, the Region of Eastern Macedonia and Thrace.
Description of the location (e.g. physical-geographic characteristics, socio-	In the area of the Municipality of Soufli, where the Wind Power Plant is located, no general urban plans have been established, nor have plans for the spatial and residential organization of the open city. The substation to which the project is to be connected is in the Municipality of Arrianon, where there are no general

¹ Wind Priority Areas (WPAs): They are the areas of the mainland, identified in the form of a table in Annex I and illustrated as set out in Annex I and illustrated in Figure 1 of this Decision (Joint Ministerial Decision 49828/2008 /Government Gazette 2464/3.12.2008), which have comparative advantages for the establishment of wind farms, while at the same time offering the achievement of the spatial objectives. In these areas, the maximum potential for siting wind farms, is estimated (carrying capacity capacity), as specified in the Annex III of the Joint Ministerial Decision 49828/2008 /Government Gazette 2464/3.12.2008.

<p>economic characteristics)</p>	<p>planning and urban development plans. In the Regional Unit of Rodopi, where the Municipality of Arrianon is located, there is an area of Specially Regulated Urban Planning, which includes the substation in spatial unit 3 (mountainous area). In the wider area, however, the General Plan of the Municipality of Alexandroupolis is being developed, which was initially approved by Government Gazette 9AD/14-1-1988, then as amended by Government Gazette 844 D/25-11-1999 and is now in stage B1 (02/2021) during which the spatial development model is being evaluated.</p> <p>Specifically for the installation area, the project is located northwest of the National Park Forest of Dadia - Lefkimi at 19 km and within the protected NATURA area "Oreinos Evros – Koilada Dereiou" with an area of 48942.19 ha and code "GR1110010". The river water body named 'Erythrotamos R.' is located south of the nearest wind turbine (W/T 10) of the project at 5,9 km.</p> <p>The project under study at the site "Pyramis Vrachou" falls within the Natura 2000 site "Oreinos Evros – Koilada Dereiou" and code "GR1110010" while the project's interconnection passes within the neighbouring Natura site "Koilada Filouri" with a code "GR1130011".</p> <p>It is not located within declared archaeological sites and monuments and is in line with all relevant guidelines and restrictions set out in the spatial and urban planning.</p> <p>The proposed activity is located on an E-W axis at an altitude of ~1000 m and around the perimeter there are hill ranges of similar altitude (900 m). In the study area and in the wider project area a road network is located which consists of agroforestry roads, provincial roads, and local roads. The nearest road to the project study area is the National Road Alexandroupolis - Mikrou Deriou which is located at 11 km.</p> <p>The site of the proposed project in the location 'Pyramis Vrachou' within the Municipal Unit of Soufli, Municipality of Orpheus is located south of the settlement of Gonikon at 3,5 km, west of the settlement of Kaliva 5 km, and west of the settlement of Chloi at 5,5 km. Steep slopes and the altitude is characterised as semi-mountainous. Most of the land is covered by forests, while there is little agricultural land, mainly in the coastal area of the unit.</p> <p>It is also important to note that the study area of the station under consideration also falls within the protected area Byala Reka with the code "BG0002019". This protected area is classified as a Special Protection Area (SPA) and is located north of the power plant at an average distance (straight line) of less than 120 m.</p> <p>The traditional agricultural activities of the local inhabitants (e.g. nomadic livestock farming, small-scale agriculture) have played a key role in the conservation of the ecosystems, maintaining sparse oak forests in part of the area.</p> <p>The mature oak trees that remain are used for pruning, i.e. collecting branches with leaves for goats to feed on in winter. The oak forests are also used for firewood production, while the beech forests and pine plantations are used for commercial timber.</p>
----------------------------------	---

The proposed project concerns the construction and operation of a wind farm with a total capacity of 34.50 MW which is in the Municipal Community of Mikrou Derio, of the Municipal Unit Orfea, of the Municipality of Soufli, of the Regional Unit of Evros, Region of Eastern Macedonia and Thrace.

The project under consideration is located outside the General Urban Plan, outside the plan of a residential area and outside the established boundaries of settlements. The nearest settlements in the study area are the following:

A/A	Name of Settlement	Population at census during the year 2021	Distance from the nearest wind turbine (km)
1	Gonikon	300	3,5
2	Kalivia	32	5
3	Chloi	280	5,6
4	Ano Kampi	15	5,6
5	Roussa	383	6,3

Details of settlements in the vicinity of the projects

In the area of the Municipality of Soufli, where the project is located, no general urban plans have been established, nor have any plans for the spatial and residential organization of the open city (S.R.O.O.C.). The substation to which the project is to be connected is in the Municipality of Arrianon, where there are no general planning and urban development plans. In the Rhodope Region, where the Municipality of Arrianon is located, there is an area of Specially Regulated Urban Development, in which the substation is in spatial unit 4 (mountainous area). In the wider area, however, the General Plan of the Municipality of Alexandroupolis is being developed, which was initially approved by Government Gazette 9D/14-1-1988, then as amended by Government Gazette 844 D/25-11-1999 and is now in stage B1 (02/2021) during which the spatial development model is being evaluated. The area in question is in an off - plan - residential area to which the building conditions of Decree 24/1985 (Government Gazette 270 D/31-05-1985) apply.

The wind turbine installation sites are compatible with social infrastructure and utilities as they are not to be affected. The nearest airport in the area is the airport "Demokritos" of Alexandroupolis, located 48 km to the south-east.

There are no social welfare facilities close to the study area, e.g. health care, education, sports facilities, urban infrastructure (e.g. recycling, waste treatment facilities, etc.) water supply facilities, livestock units, and other Areas of Organised Development of Productive Activities in the tertiary sector, theme parks, tourist ports and other statutory or designated tourist areas.

Near the project site, there is an adequate road network, consisting of forest roads, country roads and local roads.

South-east of the project, at approximately 11 km passes the National Road of Alexandroupoli – Mikro Derio.

For access to the wind turbines of the project, existing roads will be improved and a new forest road of category C' will be constructed with a total length of 6.031,65m and a width of 5 m.

The routing of the medium voltage cable that will connect the power plant to the substation will not affect technical works. The two station installation poles themselves as well as the accompanying project of interconnecting the power plant with the substation are remote from major technical utilities. As far as the road network is concerned, neither national roads nor major road junctions are expected to be affected.

As regards water supply and sewerage networks, these are not expected to be affected either. The sewerage pipes are located at a depth of around 2 m below ground level. Therefore, the Medium Voltage cable laid at 1m is not expected to affect the sewerage pipes. If a water main is identified during the excavation of the channels for the cable crossing, an alternative solution and route will be considered with the local water utility company.

Water supply pipelines do not normally run through major roads, highways, or country roads. However, even if they must go through there, their installation is done in parallel.

In addition, one telecommunication infrastructures (antennas) is located within 6 km southwest of the power plant. Under the Special Spatial Framework for (Renewable Energy Resources) RES there is no specific restriction concerning the minimum distance of the installation from the wind turbine, but it is defined on a case-by-case basis after an opinion of the competent body. In the case of the projects under consideration and according to the opinions of the authorities for the installation of wind farms, there is no restriction relating to the specific incompatible use.

The area in which the project is to be constructed does not fall within any declared World Heritage Sites and other sites of major importance.

The nearest archaeological sites and monuments identified in the vicinity of the study area are listed below:

- 10 Megalithic monuments (Dolmen): at the location of Ammohorafa (Koum - Tarla) next to the road from Mikro Derio to Roussa, 4km before Roussa, ten megalithic monuments are located. The first of the 10 monuments is located 30m SE (southeast) of the road, while the others extend over an area 2.200m SE of the first monument and are located successively at the sites: "Koum – Tarla" or "Skopia" the first one, and the rest at the Baluk - Kaya and Muslim cemetery sites of the now abandoned village of Mylopetres. The site of the monuments is 7,65km from the nearest wind turbine (W/T 10).
- The fortress enclosure, on the hill of Mesimler - Kale: It is located west of the ruined village of Mesimeri. The enclosure is 497 m long. The western and southern sides are built according to the Cyclopean system with slate. Inside there are foundations of about 50 circular and quadrilateral buildings, as well as slab-roofed tombs. On the NW and NW side of the hill, parts of a second enclosure are preserved. The monument is 7,56 km from the nearest wind turbine (W/T 10).
- To the south of the project is the onshore archaeological site of Koum-Tarla, which is a religious - burial site of the Neolithic period and is 6,12 Km away from the nearest wind turbine (W/T 10).

	<p>Finally, based on the Evros Antiquities Ephorate, which studied the project and conducted an autopsy in the area where the WPP will be installed, two archaeological sites were found in the vicinity of the wind turbine installation. One is an ancient cemetery, and the other is a tepee of ancient times, which was a meeting place. Both sites are more than 8 km apart.</p>
<p>Rationale for location of proposed activity (e.g. socio-economic basis, physical-geographic basis).</p>	<p>The area under study belongs to the Wind Priority Areas (WPA) according to the Joint Ministerial Decision 49828/2008 (Government Gazette "Special Spatial Planning Framework for RES").</p> <p>Based on the spatial plan, the wind turbines were examined regarding their compatibility, according to Article 7 of the Joint Ministerial Decision (Special criteria for the siting of wind turbines on the mainland).</p>
<p>Time frame for proposed activity (e.g. start and duration of construction and operation)</p>	<p>Once the production licenses are issued for the project under consideration, it will take approximately 18 months to conduct the studies, construct the power plants infrastructure works and connect it to the grid. Also, once the required permits are secured, the ordering of the wind turbines is conducted.</p> <p>The time required to deliver the wind turbines depends on the construction company and varies from 18-24 months. The time required for the transport from the port to the installation site and for the assembly of the turbines is 7-8 days per turbine, considering a period of 3-4 days for the assembly and disassembly of the crane and 3 days for the lifting of the tower and the installation of the wind turbine.</p>
<p>Maps and other pictorial documents connected with the information on the proposed activity</p>	<p>*Attached to the form (Topographic map, Orientation map, Map of the wider area, map of land use).</p>
<p>Additional information/comments</p>	
<p>(iii) Information on expected environmental impacts and proposed mitigation measures</p>	
<p>Scope of assessment (e.g. consideration of cumulative impacts, evaluation of alternatives, sustainable development issues, impact of peripheral activities)</p>	<p>Environmental impact is defined as the change in environmental conditions or, respectively, the change in environmental parameters (natural and man-made) prevailing in an area as a result of one or more activities. This change may be positive or negative (i.e. upgrading or downgrading the quality of the environment), long or short term, permanent or temporary, indirect, or direct.</p> <p>The establishment of Environmental Impact Assessment is one of the key tools of environmental planning. The purpose of the procedure is to assess the future adverse effects on the environment that may result from activities on the site, with a view to minimizing or redesigning them.</p> <p>The potentially significant impacts that the project or activity may cause to the environment through the use of natural resources, the emission of pollutants, the creation of nuisances and the disposal of waste are assessed and evaluated. It shall also provide the data set and a description of the methods used to predict and assess the effects on the environment, with reference to the reliability of the methods and an indication of any difficulties or lack of appropriate information encountered in gathering the required information.</p>

	<p>This means that their effects should be considered as a whole and not in isolation. Therefore, the impacts arising from the construction and operation of the studied WPPs relate to the whole of the main and accompanying projects.</p> <p>The most important positive element from the development - exploitation of wind energy is the reduction of anthropogenic impacts (as a consequence of air pollution) by replacing the combustion of conventional fuels for electricity generation, which has not been adequately assessed so far.</p> <p>The main environmental parameters associated with the construction and operation of wind farms relate to the natural environment (flora and fauna), topography and landscape. Factors such as the size of the wind turbine, the type and size of the wind turbine, the size of road works and the characteristics of the site (e.g. installation near environmentally sensitive areas) play an important role in determining the degree of pressure on the environment.</p>
<p>Expected environmental impacts of proposed activity. (E.g. types, locations, magnitudes)</p>	<p>*Attached to the form – Chapter 9</p>
<p>Inputs (e.g. raw material, power sources)</p>	<p>Construction phase</p> <p>The materials for the construction of the project are excavation, paving and cable duct products. The Necessary construction materials and raw materials for the construction of the proposed project, except for the support bases and the assembled wind turbine components, include concrete (C12/15, C20/25, C30/37, C35/45) and metal, which will be procured from local traders, steel reinforcement, sand, cables, and grounding and excavation materials for the re-foundation of the foundations. In addition, steel construction materials, structural mesh, sand, gravel, bricks, tiles, lime, marble dust, insulating materials, tiles, paints, etc. will be used. During the construction phase of the project, earthworks raw materials such as sand or gravel 3A will be required. Finally, quantities of water in the order of 20 m³ per day are necessary both for washing the machinery and for spraying the sites. During the construction phase of the project, a staff of 100-150 people will be employed. The water will be supplied by private companies or municipal services or by the municipal water supply networks of the area, in any case after agreement and payment of the relevant price, the water will be supplied by tankers and stored in plastic tanks exclusively within the intervention area of the project under study.</p> <p>Regarding the trench channels for the passage of cables. Before laying the M.V. (33KV) transmission cables, the trench for laying them shall be laid for a thickness of 0.05m with earthen material. Then the M.V. cables are placed in the centre of the trench and filled with crushed quarry sand, then the earthing cable, optical fibre is placed, and the filling continues for a new layer of sand, 0.1 m thick. Then the cable marking plate is placed, and the trench is filled with excavated screened material for a layer thickness of 0.3 m and then the cable marking tape is placed.</p> <p>Operation phase</p> <p>The nature of the project does not require the consumption of significant amounts of materials, energy, and water. Only the basic needs of the staff (consisting of 1-2 persons) who will work on the project under consideration are related to the use of resources of such inputs as well as the maintenance works of the GIS. The needs of the staff include stationery, spare parts in electrical (switches, transformers, fuses, cables) or mechanical components (gears, motors, cables, fuses) and other types of equipment for their own use (e.g. furniture, supplies).</p>

	<p>The water use during the operation of the project under study concerns the personal use by the staff for consumption and hygiene (cleaning uses). Finally, the energy inputs during the operation of the project concern the consumption of fuel for the movement of vehicles, which is small in quantity since the number of staff is small due to the automated operation of the wind turbines and does not require the daily presence of staff on site.</p>
<p>Outputs (e.g. amounts and types of emissions into the atmosphere, discharges into the water system, solid waste)</p>	<p>Construction phase</p> <p>a) Liquid waste</p> <p>During the construction phase of the overall project (WPP and its accompanying works), no toxic waste, sludge or any other form of hazardous liquid waste requiring particular care and attention will be produced and generated.</p> <p>Liquid waste is limited to that which will come from the construction site, which will be installed in the project area and will be:</p> <ul style="list-style-type: none"> • mineral oils from the maintenance of excavation vehicles and machinery, • oil or petrol from the maintenance of excavation vehicles and machinery, • liquid waste from the washing of concrete vehicles • municipal wastewater from the hygiene of the personnel manning the site. <p>b) Solid waste</p> <p>During the construction of the project, quantities of Excavation and Demolition Waste will be generated which will be managed according to Law 4819/2021. Specifically, waste will be generated that is classified under the (European waste code (EWC) 17 05 04 "soils and stones other than those listed in 17 05 03*").</p> <p>They will be temporarily deposited on site and then used for later use for backfilling required for the square and road construction. In addition, the concrete left over after the completion of the paving and foundation of the ten wind turbines will be taken to approved AECC recycling companies.</p> <p>Furthermore, the waste resulting from the hygiene of the personnel as well as from the maintenance materials and their packaging will be collected in suitable closed-type bins and transported to the waste collection points of the Municipality.</p> <p>For specific categories of solid waste, separate collection and temporary storage systems will be provided for. Once filled, they will be delivered to authorized companies.</p> <p>c) Air emissions impacts</p> <p>The air pollutants that will be created by the construction of the project are mainly dust emissions into the atmosphere caused by the earthworks and the movement of vehicles (cars, trucks, cranes) and a small amount of pollutants (exhaust gases) from the vehicles through which the construction of the project will be carried out, which will be emitted for the specific period of time that the construction will last.</p> <p>The air pollution during the construction phase of the project is due to the dust caused by the excavation work for the construction of the wind turbine squares and the interconnection roads.</p> <p>However, to minimize these pollutants, the speed limit of vehicles and the number of vehicles and machinery used will be reduced. In addition, the materials will be</p>

wetted to avoid dust dispersion and the handling of machinery at the construction sites will be as careful as possible.

d) Noise impacts

During the construction phase of the proposed project, limited noise will be generated by the operation of machinery and vehicles used for the transportation and erection of the foundations (blades, tower, etc.) of the project and for the necessary excavations for the improvement and opening of access roads, trenching and the construction site.

The assessment of the noise generated at the construction site and at the individual locations where construction machinery will be operating is carried out in accordance with the methodology proposed by British Standard BS 5228 (Noise control on construction and open sites, BSI-1984), which refers to the need to protect people living and working near such areas from noise. At this stage, it is not possible to formulate an accurate record of site operating data (types of machinery, actual operating times etc.), therefore an approximate assessment of impacts will be conducted.

We consider a mobile construction site of 12-hour operation with the following composition:

- 1 excavator
- 1 loader
- 1 leveller
- Trucks
- 1 road roller

The results of the prediction of the noise level Leq (12) for a receiver located at distances of 15 to 400 m from the source are presented in the following table.

Receiver distance (m)	20	30	50	100	200	400
Leq (12) dBa (rural area)	81	75	71	65	59	53
Leq (12) dBa (urban area)	84	78	74	68	62	56

Operation phase

a) Liquid waste

The liquid waste associated with the operation of the studied ESDP is limited and is separated into urban type wastewater from the project operating personnel and lubricating oils used in the mechanical parts.

The maintenance of the mechanical parts generates liquid wastes that fall under the European Waste List (EWL) (Decision 2014/955/EU "amending Decision 2000/532/EC as regards the list of wastes in accordance with Directive 2008/98/EC of the European Parliament and of the Council") and will be managed in accordance with the provisions of Joint Ministerial Decision 13588/725/2006 (Government Gazette 383 B/28-03-2006).

However, none of the oils used in the operation of the project contain toxic and hazardous substances such as PCBs. They consist of used mineral oils, or semi-synthetic oils or synthetic oils, from use in lubrication of gears and other moving parts and in cooling systems, from used oils of step-up transformer oils and from used hydraulic oils from use in hydraulic pressure transmission units for braking systems (brakes), pitch systems, blade rotation systems, blade tips, etc.

The recycling of waste from mechanical parts will be done in accordance with Law 2939 /2001 (Government Gazette 179 A'/06-08-2001), as in force, and Decree 82/2004 (Government Gazette 64 A'/02-03-2004) in cooperation with an appropriately licensed company or directly with an ASED or PPA. During the operation of the project, appropriate measures (recycling, removal) will be taken to ensure that waste generation is kept to a minimum and that no risks are created for the soil, air, fauna and flora and the forested agricultural and livestock area in general. Appropriate measures shall also be taken to avoid noise nuisance and to avoid any risk to public health. For the temporary storage of hazardous waste on the holder's premises until collection, suitable watertight plastic collection containers (containers) of appropriate specifications shall be used, located in an area with appropriate signage and adequate ventilation and lighting. They shall also be in such a place and in such a way that they do not interfere with other activities of the installation.

b) Solid waste

The solid type of waste from the operation of the RDF is related to waste from operating personnel and solid materials such as rubber or metal waste resulting from replacement or maintenance operations of mechanical parts, however, these quantities are not considered to be significant.

The main solid wastes that require special management in the operation of wind farms arise from the basic maintenance of mainly mechanical parts and consist of:

- Empty packaging of the above-mentioned oils: metal drums and plastic containers
- Used filters impregnated with the above-mentioned oils (usually paper and metal filters)
- Empty packaging of lubricating greases based on mineral oils and special additives.
- Empty metal containers and sprays containing adhesives, pastes, lubricants, mild solvents, and cleaners (15 01 02 and 15 01 04 and 15 01 07 and 15 01 07 and 15 01 10)
- cloths used for cleaning surfaces and therefore impregnated with the above materials (oils, greases, detergents, etc.) (15 02 02)
- Low-capacity accumulators (batteries) for use in automatic gear cutting machines and general small automation (16 06 01 and 16 06 04)
Higher capacity batteries for use in UPS systems (16 06 01) The above materials are covered by hazardous waste legislation.
- Waste of mechanical, electrical, and electronic equipment.
The above materials are not considered as hazardous waste.

- The classification, storage and management of waste generated by the operation of Wind Power Plants are subject to the provisions of Greek legislation, from which the obligations of the owner of the Wind Power Plant (Holder of hazardous waste), namely the Joint Ministerial Decision 13588/725/2006 (Government Gazette 383 B'/28-03-2006) and the Law 4819/2021 (Government Gazette 129 A'/23- 07-2021).

- The project promoter will conclude contracts with certified companies for the transport and management of the waste to be produced. In particular, the municipal type of waste will be disposed of in agreement with the relevant local authority. A table with the relevant ESW codes of the solid waste likely to be generated during the operation phase of the project is provided below:

Waste codes/Waste type.

07 02 13 / plastic waste

15 01 01/ paper and cardboard packaging

15 01 02/ Plastic packaging

15 01 04/ metal packaging

15 01 05/ synthetic packaging

15 01 06/ mixed packaging

15 01 07/ glass packaging

15 01 10*/ packaging containing residues of or contaminated with dangerous substances.

15 02 02*/ absorbent materials, filter materials (including oil filters not otherwise specified), wiping cloths, protective clothing contaminated with dangerous substances.

15 02 03/ absorbent materials, filter materials, wiping cloths and protective clothing other than those mentioned in 15 02 02.

16 02 16 /components removed from discarded equipment other than those mentioned in 16 02 15.

16 06 01*/ lead-acid batteries

16 06 04/ alkaline batteries (except 16 06 03)

17 02 02/ Glass

20 01 36/discarded electrical and electronic equipment other than those mentioned in 20 01 21, 20 01 23 and 20 01 35.

20 02 01/ biodegradable wastes

20 03 04/septic tank sludge

c) Air Emissions impacts

The emissions of pollutants and dust associated with road traffic are estimated to be extremely limited to negligible despite the fact that the roads are planned to be paved, as they will be used exclusively for the approach to the EIAs under consideration. Furthermore, not only are no greenhouse gases produced, but on the

contrary, the production of greenhouse gases and other harmful pollutants is reduced as a result of the operation of the projects under consideration.

d) Noise emissions

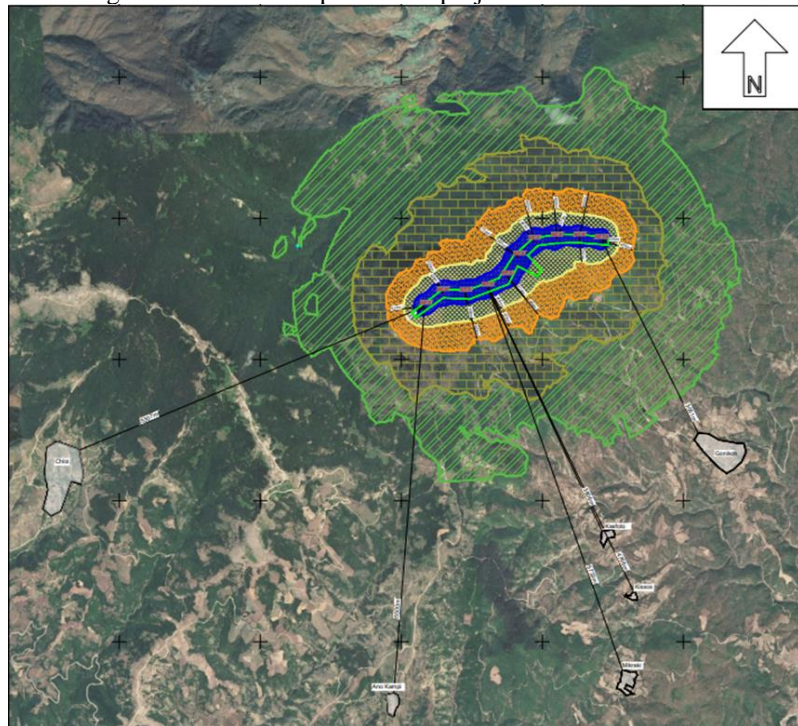

The exploitation of wind energy, despite its environmental friendliness, may cause acoustic disturbances. The proposed project, given its location and the specifications of the type of wind turbines to be used, will not cause acoustic disturbance in the area.

According to the noise study (attached in the appendices to this document), which was conducted as part of this EIS, the following conclusions were reached:

- The noise curves that exceed the maximum permissible noise limit of 45dB(A), as set in the Special Spatial Plan for RES and in the Decree 1180/81 (Government Gazette 293/A/6-10-1981), extend to radii of less than 734m from the wind turbine centers.
- The nearest settlements to the wind farm are Chloi, Ano Kampi, Mikraki, Kissos, Ksefoto, Gonikon and Roussa where the noise generated by the wind turbines is below the maximum permissible limit. The noise generated by the W/T (wind turbines) at a distance of less than 200m, where no point of interest is sited, is the same as that heard when it is drizzling.

It should be stressed that this is the worst-case scenario and that in reality this noise, will only be for high wind speeds (>8 m/s), a few days during the year mainly in the summer period. In this case, the ambient noise will overwhelm the noise of the W/T and therefore, the sound emissions caused by the source alone will not be perceived.

The following is the noise curve plan of the project.

Equilibrium Curve Drawing (for noise)

	<p>The table below presents the results of the noise study in the nearest project area.</p> <table border="1" data-bbox="507 315 1382 651"> <thead> <tr> <th>Points of interest</th> <th>Closest W/T</th> <th>Distance (m)</th> <th>Noise Level dB(A) (Pyramis Vrachou)</th> <th>Noise Level dB(A) (collectively)</th> </tr> </thead> <tbody> <tr> <td>Settlement – Goniko</td> <td>W/T10</td> <td>3.051 m</td> <td>32,5</td> <td>43,85</td> </tr> <tr> <td>Settlement – Ano Kampi</td> <td>A/T1</td> <td>5.500 m</td> <td>19,71</td> <td>31,73</td> </tr> <tr> <td>Settlement – Mikraki</td> <td>A/T4</td> <td>5.733 m</td> <td>20,38</td> <td>33,25</td> </tr> <tr> <td>Settlement – Ksefoto</td> <td>A/T4</td> <td>3.806 m</td> <td>28,94</td> <td>42,29</td> </tr> <tr> <td>Settlement – Roussa</td> <td>A/T10</td> <td>5.841 m</td> <td>21,46</td> <td>39,13</td> </tr> <tr> <td>Settlement – Kissos</td> <td>A/T4</td> <td>4.766 m</td> <td>24,23</td> <td>37,52</td> </tr> <tr> <td>Settlement – Chloi</td> <td>A/T1</td> <td>5.307 m</td> <td>18,96</td> <td>28,96</td> </tr> </tbody> </table> <p style="text-align: center;">Summary table of noise study results</p>	Points of interest	Closest W/T	Distance (m)	Noise Level dB(A) (Pyramis Vrachou)	Noise Level dB(A) (collectively)	Settlement – Goniko	W/T10	3.051 m	32,5	43,85	Settlement – Ano Kampi	A/T1	5.500 m	19,71	31,73	Settlement – Mikraki	A/T4	5.733 m	20,38	33,25	Settlement – Ksefoto	A/T4	3.806 m	28,94	42,29	Settlement – Roussa	A/T10	5.841 m	21,46	39,13	Settlement – Kissos	A/T4	4.766 m	24,23	37,52	Settlement – Chloi	A/T1	5.307 m	18,96	28,96

<p>Transboundary impacts (e.g. types, locations, magnitudes)</p>	<p>There are no transboundary impacts. More information about transboundary impacts for the protected Natura area “Byala Reka” is recorded in the Special Ecological Assessment (SEA) document that is attached to this form.</p>																																								
<p>Proposed mitigation measures (e.g. if known, mitigation measures to prevent, eliminate, minimize, compensate for environmental effects)</p>	<p>Mitigation measures to address impacts to vegetation, flora, and fauna during construction of the project are summarized as follows:</p> <ul style="list-style-type: none"> - The extent of the project occupation zone to be limited to the extent strictly necessary for the construction of the project. - The spatial planning of the project should be as clear and detailed as possible so as to minimise the impact on woodland. The felling and uprooting of bushes and trees and the disposal of the products must be conducted in accordance with the provisions of forestry legislation and the instructions of the competent forestry department. - Provision will be made for all necessary measures to protect workers or visitors to the forest area. In this connection, it is necessary to place elegant signs warning of the possible risks involved at appropriate distances. - Fire protection measures will be taken to protect the vegetation in the vicinity of the works to be constructed, which will be maintained to provide fire protection during its operation. - No uncontrolled dumping of rubble, lubricants and other wastes or refuse will be allowed at any location within or outside the two polygons of the power plant site, nor within the immediate sitting areas of the other parts of the project under study. - The extent of roadway excavation to be limited to the extent of roadway excavation. The extent of clearing for the installation of the wind turbines shall be limited to the area of each wind turbine considering the necessary size of the plazas. In general, the areas where existing vegetation will be cleared will be limited to those absolutely necessary. For this reason, the construction works will be preceded by a precise delimitation of these areas by a team of surveyors. A special tape will be placed on these boundaries so that the deforestation area is clearly identifiable. - The width of the road network will not exceed the width specified in the relevant road construction study. - The installation in the area of the project promoter, since it is a forested area under the classification acts, will be conducted in accordance with the legislation in force, with the issue of an installation protocol by the competent forestry department and under its supervision and instructions. <p>It is also proposed to implement horticultural interventions which will have as a main objective:</p> <ul style="list-style-type: none"> - The restoration of the natural environment from the alterations that will be caused to the natural vegetation due to the construction of the project and the harmonious integration of the roads into the landscape. 																																								

	<ul style="list-style-type: none"> - The restoration of the vegetation to be removed during the excavation works. In the event of the removal of trees or dense stands of shrubs, it is proposed to replace them, possibly in the form of tree planting on the boundaries of the intervention area. - Protection against erosion of the soil surface of the embankments, which is mainly caused by the effect of rainwater, with the drifting of various particles from the embankment body, the maximum percentage of which (around 75 %) usually takes place in the first autumn and winter period after the end of earthworks. - To this end, earthworks will be followed by erosion control works, which will prevent the loss of valuable soil and the creation of furrow erosion before sufficient vegetation has developed. Vegetable land existing in the area where the project is to be conducted will be collected and stored for use during the restoration work. - The planting of the embankment slopes and deposits will be conducted in a single layer of lightly compacted vegetated soil with a minimum thickness of 0,20 - 0,30 m. - The direct covering of the vegetative soil will have the effect of slowing down the evaporation of water used in the construction of the embankments. The presence of moisture in the embankments will aid rapid natural regeneration and thus both the sparse vegetation, which will emerge immediately, and the root system of the plants, which will grow later, will exert a stabilizing effect on the surface of the embankments. - With regard to the planned plantings, it is proposed to prepare a study on the horticultural restoration of the intervention areas, which will be submitted in accordance with the procedure provided for in Ministerial Decision 15277/2012 (Government Gazette 1077 B/09-04-2012), considering any relevant recommendations of the competent Forestry Authority. - Any planting work shall commence immediately on each section of the project where earthworks are completed, and final surfaces are formed. The planting work will include the preparation of the sites for the plants (final shaping of the ground surface, coating of planting soil) and the supply, installation, and maintenance of the plants. - Planting soil existing in the project area will be collected and stored for use in the restoration works. In the event of excess plant land in one area, quantities may be transferred from one area or part of the project to another. - The proposed landscaping is intended to provide plantings on the surfaces of embankments and road slopes to protect against surface erosion, reduce surface moisture, and water evaporation. - As regards the species to be used for planting, they must meet the following requirements: <ul style="list-style-type: none"> 1. They must be species which are adapted to the climatic conditions of the area. 2. They must meet the requirements of the intended purpose. <p>The selected final species (and the way of restoration) will be finalized in cooperation with the competent Forestry Department and with the preparation of a relevant study. In general, the purpose of the restorations is as follows:</p> <ul style="list-style-type: none"> 1. Restoration of disturbed natural surfaces. 2. To restore (to the maximum extent possible) the landscape and vegetation balance to their original state. 3. To better harmonize and adapt the new road network to the natural environment. 4. To protect the soil from leaching, surface water runoff by creating woodland. - Any vegetation damage to be limited to the minimum possible and always in accordance with the instructions of the competent Forestry Department. - During the earthworks, reduce dust dispersion by wetting the soil in the event of adverse weather conditions. - Any natural vegetation that may be altered and not covered by infrastructure will be restored after completion of the works. An appropriate restoration program will be implemented after approval by the competent Forestry Department and
--	--

	<p>preference will be given to native species of the area. Plant care will be continued for at least 2 years after planting.</p> <ul style="list-style-type: none"> - Once the wind farms and their accompanying works have been completed, all construction sites will be removed. The site will be landscaped and restored to its previous condition, where possible, by planting. - Prior to the granting of the operating license, a Vegetation Restoration Study shall be submitted to the competent Forestry Department, both for the areas where the access roads cross and interconnect to the trenches and their embankments, and for the landscaped construction squares. <p>During the operational phase of the project, all measures should be taken to maintain the plantations, as they contribute to the improvement of the landscape of the area. In particular, in the first year after planting, any gaps that may occur due to the death of seedlings will be filled in.</p> <p>The project design already incorporates measures and precautions to ensure that any impact on the area's birdlife is minimized.</p> <p>Few of the main points are briefly highlighted:</p> <ul style="list-style-type: none"> - The total area occupied by the wind turbines is small. The area within the boundary of the wind farm that will eventually be left unused after the works are completed will clearly be re-used by the birds and other fauna of the area, thus ensuring minimal change to the existing habitats in the area. - The electricity generated will be transported entirely by underground medium-voltage lines. - It is proposed to establish a mandatory post-construction monitoring programme and assessment of vulture mortality and displacement from the project by applying a specific methodology/establishing it as an Environmental Condition (in Decision of Approval Environmental Conditions of electricity generation and transmission projects, e.g. power plants) - Regarding waste (solid and liquid, hazardous or non-hazardous) resulting from the site activities during construction and operation of the works, appropriate management should be applied to avoid pollution of the area (soil, subsoil, surface, and groundwater) from uncontrolled disposal or spills. When restoring the vegetation in the installation area, the possible attraction or repulsion of bird species should be considered. <p>For example, it is important that there is no large area of bare ground on ridges, as this creates strong thermal updrafts and encourages predator hunting, thus attracting more species to exploit these currents or for foraging. Removal of dead animals given the presence of livestock activity in the area, dead animals (dogs, sheep, goats, horses, cows, etc.) found within 400 m of the base of the W/T should be removed. In general, to protect the natural environment of the study area.</p> <ul style="list-style-type: none"> - The proposed environmental conditions of the project under study should be strictly observed, provide detailed information to workers involved in both the construction and operation phases, so that all environmental conditions, particularly those relating to the natural environment, are respected.
<p style="text-align: center;">Additional information/comments</p>	<p>10.4.1. Addressing Fauna - Bird Mortality</p> <p>Bird mortality is one of the key ecological concerns in the development of power plants, raising concerns particularly regarding bird impacts on the W/T.</p>

In the context of legal compliance with both domestic law and EU Directives and ecological awareness in general, the obligation to protect wild birds and habitats with the help of technology, thus preventing birds from colliding with the W/Ts, has arisen. One way of meeting this obligation is to install systems to prevent birds from colliding with aircraft. Thus, it was decided to use such a system, namely the Bird Monitoring System (BMS) using Artificial Neural Networks and Machine Learning, owned by DIGISEC SA, which consists of both hardware and software, and will be installed on the pylons of the W/Ts.

Therefore, special high-resolution cameras and reflection horns (speakers) will be installed on the outside of the aircraft, on the tower, at a height of approximately 10 m, to prevent birds heading towards the aircraft.

This Bird Monitoring System uses high-tech cameras that continuously scan the covered area, detect birds far enough away and decide, with unprecedented accuracy, whether they are on a collision course. The high-tech cameras continuously scan the covered area for birds. The bird detection system uses advanced artificial intelligence and a Machine Learning algorithm to identify birds and other objects. The bird detection system could continuously improve its detection capabilities using Machine Learning video content analysis algorithms. It uses advanced classifiers and large databases to achieve its performance. Also, in this system images and video sequences can also be recorded and further use.

Thus, after birds are detected flying in the high-risk collision area, they receive acoustic warnings through special sounds. The behaviour of the birds is monitored during and after the warning and if their flight direction is not adequately diverted, the sound is applied again until the birds leave the protected area. If this is not successful, the system automatically switches off the W/T to protect the birds from a possible fatal collision. However, advanced detection technology minimises the incidents of W/T shutdown.

Installation of a Bird Monitoring System at the Jasper Energy Wind Farm in Stavros Evia

Detection field of view lobes

Vertical and horizontal field of view

For the aforementioned system, a team of the Faculty of Engineering of the University of Western Macedonia carried out a research of this system, which was carried out for six months in the period between July 1 and December 31, 2021 in a specific location (Power Plant "Orpheus - Eptaendros" in Alexandroupolis), and prepared a relevant Research Report for the investigation, evaluation, reliability and effectiveness of the system for the prevention of bird collision in W/T using Artificial Neural Networks and Machine Learning. This Research Report is attached in the Annex of the EIA.

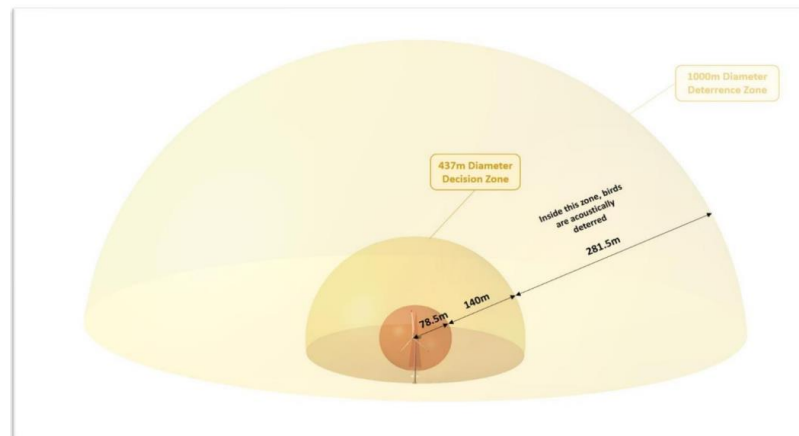

According to the conclusions of the aforementioned research, the effectiveness of the system to be used by DIGISEC SA was found to be satisfactory in terms of detecting and deterring birds to reduce their risk of collision, with expected deviations in its performance depending on weather conditions, but not significant. Also, as regards the shutdown of the W/T as a last resort to deter bird impact, it was found to be effective.

It is worth noting that the BMS technology to be used has the following operating principles:

1. Surveillance phase where high resolution cameras continuously scan the covered area for the presence of birds. The BMS uses advanced Starlight Cameras / Thermal Cameras configuration combined with Artificial Intelligence to identify them. It can distinguish the differences between birds and other flying or moving objects. The BMS has the ability to

continuously improve detection capabilities using the Machine Learning Algorithm and Video Content Analysis Algorithm Learning Engine. Uses classifiers and large databases to achieve its performance. Images and video sequences can also be captured and stored for future use.

2. Deterrence phase where birds flying in high-risk areas are detected. The collision area receives audible warnings via directional speakers with the behavior of the 'treated' birds monitored during and after the warning. If the direction of the flight path is not diverted sufficiently to avoid a collision, the sound is reapplied until the birds leave the protected area.
3. Shutdown phase where further actions are taken, and the System automatically shuts down the turbine to protect the bird from a potentially fatal collision. However, advanced detection technology minimizes the occurrence of Wind Turbine shutdown.

Schematic representation of Deterrence and Detection Zones

Therefore, and in conclusion, the BMS system in use is considered to be an effective means of reducing the risk of birds colliding with the A/C.

It is worth noting that the BMS technology to be used has the following operating principles:

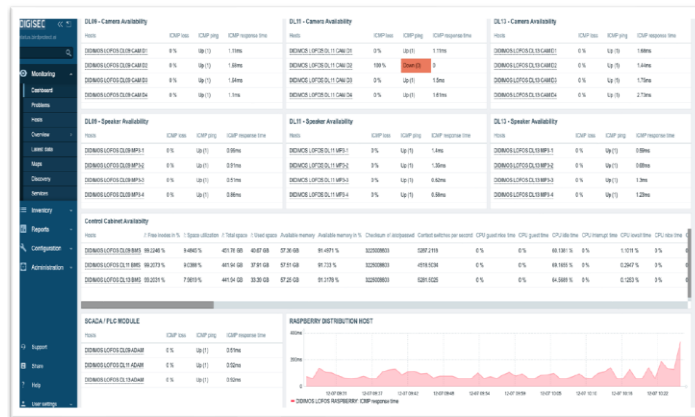

Software engine

	<p>Use of state-of-the-art Artificial Intelligence algorithms to detect birds in danger zones. This system can continuously improve its detection and has capabilities that use Machine Learning technology.</p> <p><u>Deterrence module</u> Based on the detection and classification process, advanced acoustic driver module is used to deter birds from entering the danger zone of the turbine. This system uses adjustable directional sound emission, minimizing noise pollution.</p> <p><u>Detection unit</u> Use of Ultra High-Definition cameras combined with thermal imaging technology to achieve 24-hour all-weather detection and operation. The system can detect birds from distances up to 1 Km.</p> <p><u>Stop Turbine Unit</u></p> <p>In the extreme scenario where a bird enters the critical zone, the turbine receives signals in various forms in order to stop its operation and thus prevent a collision. The advantages offered by this system are set out below:</p> <ul style="list-style-type: none"> - Artificial intelligence detection algorithm - Computer Vision & Machine Learning technology - Minimum sound pollution - Adjustable directional sound - Operation in all weather conditions - Operation in all weather conditions - Bird classification - Zero false positives - Minimum downtime - Maximum turbine operation - Advanced Cloud monitoring, reporting and management platform. - Support GPS/GIS Geofencing, for tagged birds - Integrated CCTV surveillance <p>Thus, from the above bird monitoring system, the following services are discharged.</p> <p><u>Reporting of bird/bat incidents</u></p> <p>Generate a report on bird and bat activity which can be submitted at any time to the local environmental authorities and any other relevant authority. Reports include raw data events, statistics, graphs, and tool tables.</p> <p><u>System health status report</u></p> <p>Report health status reports, thus indicating the availability of systems at the selected period, documenting the final submitted report in the most effective way.</p> <p><u>System health status monitoring</u></p> <p>Use of advanced software to continuously monitor system health status. Also, alarms and alerts are received automatically, thus enabling remote troubleshooting of any problems as well as restoring functionality.</p> <p><u>Service level agreement.</u></p>
--	---

A service level agreement may take place, focusing on the day-to-day operations and support processes to ensure efficient and reliable services for the operation of the system.

Software of the bird monitoring system

Real-time and graphical system monitoring

Finally, to protect the external bird monitoring system during the winter months, ice deflectors will be installed, as shown in the image below:

Installation of ice deflectors

In addition, it should be mentioned that the proposed system also considers the species conservation objectives set by the Decree of the Ministry of Environment/DFPB/50146/1786/2023 (Government Gazette 3118 B/10-05-2023) for the examined areas SPA GR1110010, S.P.A). SPA GR111001, GR1130011 and SPA GR1110002 with regard to the species for which data currently exist and are presented in detail in Chapter 9.

In conclusion, the proposed system to be used is considered to be very effective both in terms of detecting and preventing the risk of collision with the W/Ts under study and in terms of reporting correct monitoring and understanding results.

Additional measures conditions and restrictions are presented below and are also discussed in detail in the SEA Document, i.e:

A) Measures proposed for implementation

- ✚ Installation of an optical system for automated wind turbine shutdown. In this project it is proposed that the installation of the optical system is mandatory from the start of the project due to the importance of the area. The system is proposed to be set up in such a way that it will operate without bird deterrence (sound repulsion) during the breeding and chick fledging periods but only by stopping the wind turbines so that there is no possibility of disturbance to the species and displacement of the species from the study area. Given the morphology of the terrain and the possibility of the passage of species of interest perpendicular to the axis of the project from a low height (presence of a 'blind spot'), it is compulsory to draw up a preliminary study for the correct positioning of the camera angles. For those turbines where this cannot be covered by the installation of four cameras mounted on each turbine, it is proposed that a second set of cameras (eight tracking cameras on each turbine instead of four) should be mandatory in order to fully cover the detection of the object of interest from all directions of the horizon and from all possible heights. During the periodic or permanent shutdown of any wind turbine(s) for any reason, the operation of the automated systems will also be interrupted in order to avoid any disturbance and displacement of species due to the emission of repulsion sounds. The system shall also cover at least the activity of medium-sized and

	<p>large birds of prey and scavengers at a distance of more than 500 m and a sufficient number of cameras to detect birds on the ascent from locations at lower altitudes than the W/Ts. Other important parameters to be adjusted are the correct parameterization according to the biometric characteristics of the species in the area and the short response time from species detection to the complete stop of the turbine, data that are subject to modifications some of the commercial models of automated wind turbine shutdown systems. It is also proposed that the installation of the above system should be measured by at least three ground observers who will also have the ability to stop the turbine in the event that dangerous flight of species of interest is detected, until such time as the above automated stopping system is properly configured.</p> <ul style="list-style-type: none"> ✚ Rest or supervision places. Any installation of any penned structures that allow birds to sit and congregate will be prohibited. ✚ Shutdown of the project during conditions of limited visibility due to cloud cover and extremely adverse weather conditions. In the event of severe weather events such as intense foggy conditions or extreme weather events (thunderstorms), incidents of impacts have been observed as visibility is significantly reduced. Shutting down the turbines in this case will help to reduce the risk of birds colliding with the turbines. Consideration will also be given to implementing a measure with appropriate programming of the software of the automated systems while keeping records that will be communicated to the Evros and Dadia Delta National Park Management Unit. Semiannual reports will also be made with the prevailing climatic conditions and the corresponding shutdown periods of the W/Ts. ✚ Avoidance of constant lighting of wind turbines to reduce the risk of bird strikes. Consider using white strobe flashing lighting which will be less attractive to birds. ✚ Undergrounding cables to avoid the risk of electrocution and birds colliding with them. Electricity transmission infrastructure (in general, but also in the case of wind farms) should be underground. The wind farm in question is proposed to be connected to the grid underground. ✚ Removal of dead animals such as mammals, dogs, sheep, goats, horses, cows, etc. found within a radius of at least 500 m from the base of the wind turbines. These dead animals should be transported to safe locations away from the wind farm, while remaining available for scavenging birds and carnivorous omnivores. This will reduce the risk of scavenging species colliding with the wind turbines when they spot each dead animal and will not affect the availability of their food. The responsibility for the collection, transport and removal of dead animals will be the responsibility of our company, as the project proponent, and in particular the personnel hired during the operational phase of the project who will have been trained and informed on environmental protection issues (fire protection, waste management, dead animal management) and in particular on the detection of dead or injured animals. It is also proposed to place signs for other users or visitors to inform them of the above situations and to provide useful contact numbers for the relevant bodies.
--	---

	<ul style="list-style-type: none"> <li data-bbox="608 194 1398 472">✚ In the event of a dead animal being found, the company, as the project proponent, should dispose of them at existing licensed raptor feeding sites (in cooperation with the Management Unit after checking that they are not poisoned). If the dead animals are checked and found to be poisoned, then the poisoned bait detection team should be notified and managed appropriately. Any animal species found (hand-fly, bird) will be recorded on a special form (protocol for recording the checks conducted). <li data-bbox="608 472 1398 786">✚ Along with the above actions, the competent forestry authority and the Management Unit must be notified. For the correct recording of the data of the finding, the dead animal should not be moved, in order to reliably assess the actual date, its condition, the exact weather conditions and the correlation or not with the operation of the W/Ts. In the event that an injured bird is found and cannot fly, the competent authority shall be notified immediately so that the appropriate procedure can be followed, and the bird can be provided as soon as possible. <li data-bbox="608 786 1398 1279">✚ In addition, construction work shall not be conducted during critical periods for the fauna of the area (breeding season for fauna species or nesting and rearing of bird chicks). Investigate incidents of bird or bat collisions. It is important to note that in addition to the search for dead animals, bird and bat collision surveys will also be conducted. For best results (in case the terrain and/or vegetation cover of the field survey area makes the search task difficult), it will be conducted with the help of a specially trained dog. It is proposed to estimate mortality by applying mathematical models such as Genest to better estimate impacts and to record the results in relevant annual reports/reports. Furthermore, actions to inform local residents as well as other supporting actions to deal with poisoned baits will be supported in cooperation with the Management Unit and/or as part of the implementation of the local action plan. <li data-bbox="608 1279 1398 1525">✚ In case of detection of nests of species listed in Annex I of Directive 2009/147/EU, it is recommended that W/Ts located at a distance < 1 km from a nesting site should remain out of operation half an hour before sunrise to half an hour after sunset from 15 March to 15 July. To assess nests in the project area and implement the measure, field surveys will be conducted weekly in the second half of March and April. <li data-bbox="608 1525 1398 2018">✚ Restoration of the surrounding area. After the construction phase, it is proposed that all roads and encroachments that have been made will be restored in order to return the area to its former condition and reduce disturbance. The quantities of surplus materials resulting from road widening will not remain in the project area but will be collected and transported to a specially licensed site. It is also proposed that upon completion of the project construction, a barrier be placed at the beginning of the sections of the new openings, and that only the personnel responsible with the maintenance and operation of the project and of course the relevant agencies that have the study area as their area of responsibility will have access. In addition, it is important that the road deck width be kept to a minimum for post-construction maintenance needs only, given that the needs of the project after construction are much less than during
--	--

the construction phase, it is proposed that the width of the road deck after construction be kept to the minimum required for the maintenance and operation needs of the project.

- ✚ Provision to limit mortality of herpetofauna during the construction phase. In the wider construction area of the project under study, individuals of the gray turtle (*Testudo graeca*) and the Mediterranean turtle (*Testudo hermanni*), which are species listed in Annex II of Directive 92/43/EEC and at the same time species with a limited ability to avoid anthropogenic hazards due to their low speed of movement, were observed. In order to protect these species, it is proposed that during the construction phase of the project and its accompanying works, a specialist should carry out daily monitoring of the areas likely to be affected by earthworks (e.g. new sections of openings) and that individuals of the above species likely to be found should be moved outside the area occupied by the above works. This will also prevent the accidental mortality of individuals of the above species during the construction phase of the project.
- ✚ Monitoring of possible impacts on avifauna – fauna. Our company, as the project proponent, will be required to monitor the impacts on avifauna and other terrestrial fauna after construction, and during the pre-construction and construction period, for a minimum period of at least four (4) years (monitoring program) in total. The monitoring will be carried out by a team of expert scientists, following a specific monitoring protocol so that there is a continuous acquisition of data which will be available to all stakeholders and interested parties.
- ✚ Monitoring will be applied during the preparatory and construction phases as well as during the first two years of operation of the project:

In detail, the monitoring program will include

- ✚ Regular recordings (proposed every 15 days (twice a month) of the critical periods and every 20 days (3 times every 2 months) the rest of the time) related to the risk of collision and the detection of nests in the area. Project site use data logging program and recording of flights of important species in the project area and their interaction with wind turbines (potential disturbance and displacement from specific feeding area or nesting sites, assessment of impacts related to displacement, barrier, and impact). The monitoring program for the recordings will also apply to the type of handlers by qualified scientists in order to ensure proper selection of methods - monitoring, based on the standards of corresponding international - research programs, proper assessment of impacts and, by extension, proper selection of mitigation measures.
- ✚ Map illustration of the above to assess the situation.
- ✚ Monitoring and recording of potential mortality in a special protocol to be maintained by the company and available to the relevant agencies for the control of impact incidents in the area.
- ✚ Training of the employees of the power plant to deal with incidents of injured birds and immediate notification of the competent services - agencies.
- ✚ Training of the employees of the power plant for the sweeping of the area
- ✚ of the wind turbines to find dead birds and check the correct application of the procedure by means of inspections.

✚ Assess the situation based on the information gathered.

B) Measures whose feasibility will be examined in the subsequent monitoring stages

✚ In the event that, during the subsequent monitoring stages, a change in the frequency of passage of important bird species is observed and it is considered that, on the basis of the new data obtained, the risk of collision or accident is increased, the following measures are proposed and, after documenting them, the most effective ones may be proposed.

✚ After the construction of the wind farm, it is possible to actively manage the habitats in and around the wind farm so that birds are not attracted to the zone of influence of the wind turbines and move to places that do not provide impact sites. The responsibility for the design and implementation of the management actions will be the responsibility of the wind farm operator.

✚ Active management of habitats under the wind turbines.

✚ In cases where certain impacts (increased concentration or mobility of species on the site, incidents of impact of specific species) on specific wind turbines are identified after construction, it is proposed to design active management actions for the areas underneath them (creation of undesirable habitats for birds) after appropriate studies.

✚ Active management of habitats around the wind farm. In cases where the wind farm is located in an area where there is a need for bird protection measures, habitat management will take place around the periphery of the project to create suitable habitats to attract birds away from the turbines.

✚ Increasing the starting speed of wind turbines. If the installation and operation of the proposed wind turbine will have an impact on Chiroptera (considerable number of Chiroptera killed by the operation of the wind turbine), it is proposed to apply the measure of increasing the starting speed of the wind turbines. When implementing this measure, it is suggested, to avoid the wind conditions with the highest bat activity, to increase the wind turbine start-up speed and blade rotation to avoid rotation of the wind turbine rotor at low wind speeds of 3.5 m/sec (Fric et al. 2018). Wind turbines "spin freely" at wind speeds lower than the wind activation speed (i.e., the minimum speed at which wind turbines produce energy). The unnecessary activity of wind turbines described above can be reduced in three ways: a) by sweeping the blades (so that they are parallel to the direction of the prevailing wind, effectively reducing their surface area), b) by increasing the activation wind speed, and c) by implementing methods that prevent the blades from rotating at lower wind speeds (Rodrigues et al. 2015, Arnett 2017). Evidence from Europe and North America suggests that trimming and increasing wind activation speed are the only proven ways to reduce bat mortality due to impact (Rodrigues et al. 2015, Behr et al. 2017).

✚ Monitoring possible impacts on handrails. If there is an impact on chiral mammals from the installation of the proposed ESRP once it is identified, it is proposed to monitor the potential impacts on birds and other terrestrial fauna in parallel with the monitoring of impacts on chiral mammals. This monitoring should be carried out by experts in order to ensure the correct selection of monitoring methods based on the standards of relevant international/national research programs, the correct assessment of impacts and, consequently, the correct selection of additional mitigation measures (if any), e.g. e.g. even avoiding activities during periods when bats are most sensitive to disturbance

(e.g. breeding, hibernation), as well as during transits and foraging based on local knowledge, etc. (Fric et al. 2018).

- ✚ Wind turbine blade base in black. A recent study has shown that painting wind turbine blade part with black or red paint will help reduce the mortality rate compared to wind turbines where this activity does not take place, specifically for raptor species that are considered species of interest in the Special Ecological Assessment as they have been shown to have high visual acuity and sharp vision at long distances.
- ✚ Full shutdown of the power plant during sensitive periods. In the event that the processing of the monitoring system recording data after the installation of the project under study indicates that the risk of bird impact is high and cannot be reduced through periodic shutdowns, then a full shutdown of the project may be proposed for as long as necessary.

C) Interventions to mitigate potential future cumulative impacts

- ✚ In accordance with the Special Ecological Assessment (SEA), this section presents a proposal for mitigation measures for possible future cumulative impacts, based on the proposals of the European Action Plans, which are based on the following actions that could be adopted in case of installation of all the planned WPP within the protected areas under study.
- ✚ In the Special Ecological Assessment (SEA), potential significant impacts have been assessed in the case of the construction of all of the WPPs currently under license within the protected areas under consideration, however the contribution of the power plant under consideration is assessed as minor.
- ✚ However, in order for both this and the other projects under licensing to mitigate any negative impact on the ecologically sensitive area under consideration, it is proposed that they contribute to a broader action plan of cumulative impact mitigation interventions in line with the recommendations of the National Scavenger Species Action Plan (Xirouhakis 2019).

The European (EuroSaps) Action Plans have been extensively analyzed in Chapter 5 and in the Special Ecological Assessment, which list the threats faced by the species, the targets, and proposed measures to address them by country, as well as the (2) National Action Plans for Birds, which set out specific targets and measures for threatened species.

The following tables detail the proposed measures of the two (2) National Action Plans in relation to the existing threats.

Aims	Measures/Actions	Relevance to existing threats
Improvement of knowledge and documentation of the effects of the use of pesticides and other banned toxic substances in poison baits on the viability of vultures	Implementation of a uniform information collection system with specific protocols for the recording of poisoning incidents and collection of dead animals by public services (Directorate of Veterinary Services Ministry of Rural Development and Food/Ministry of	Illegal use of poison baits

		Environment & Energy). Issue of a relevant circular.		
		Development of an easy to use, standardized and seamless system for the storage and transport of dead vulture tissue/organ samples through the competent services and certified procedures for toxicological analyses.		
		Reinforcement and operation of a Veterinary Centre in Athens. Conducting necropsies, histopathological examinations, and toxicological analyses on poisoned/dead vultures		
	Reduction of vulture mortality due to consumption of poisoned baits.	Amendment and implementation of the Joint Ministerial Decision "Local Action Plan to prevent the illegal use of poisoned baits" (Government Gazette 3793/B/3-9-2018) and development of a new relevant Joint Ministerial Decision in cooperation with the Ministry of Rural Development and Food to cover errors and legislative gaps that have already been identified in its implementation. Adoption of a Strategy/Roadmap and establishment of a working group for the collective implementation of measures in local action plans		
		Establishment and operation of seven regional teams of dogs specially trained in the detection of poison baits/ Systematic patrols/inspections in critical high-risk areas by the Forestry Services (or other relevant services).		
		Implementation of loss prevention methods to reduce losses in crop and livestock production (e.g. subsidies for electric fencing, etc.) and pilot application of new techniques (e.g. fladry technique)		
	Reduction of interactions/competition between carnivorous mammals and human activities	Improvement of the compensation scheme of the Hellenic Organization of Agricultural Insurances		1. Illegal use of poison baits
	Reduction of interactions/competition between carnivorous			

	mammals and human activities	(simplification of the declaration and inspection procedure for compensation, reduction of the minimum number of animals required, reduction of the payment time, compensation of 100% of the value of the damage, etc.) and linking compensation schemes to preventive measures in areas of high risk of attacks and high risk of livestock losses.	
		Maintenance of high densities of wild ungulates (mainly chamois, deer) to ensure food supply for wild carnivores through appropriate management (e.g. reintroduction, strengthening of small populations, regulation of livestock grazing, ensuring access to water bars, guarding populations).	<ol style="list-style-type: none"> 1. Illegal use of poison baits 2. Food insufficiency 3. Degradation of foraging habitat.
	Minimization of vulture mortality due to NSAID consumption.	Investigation and monitoring of the use/approval of veterinary formulations of non-steroidal anti-inflammatory drugs (NSAIDS) that are harmful to vultures in their critical areas/inform users of their harmful effects through vulture population management seminars.	Use of Harmful Veterinary Formulations
	Assessment of mortality due to electrocution and collision with electricity generation and transmission infrastructure	Establishment of protocols and composition of guidelines on systematic monitoring (recording of dead birds) in existing electricity transmission networks in the vicinity of breeding and roosting sites of vultures.	Electrocution & Impact on man-made structures & infrastructure.
	Establishment of mandatory post-construction monitoring programs and assessment of vulture mortality and displacement from power generation and transmission infrastructure using a specific methodology. Establishment of an Environmental Condition (in approvals of environmental terms and conditions of power generation and transmission projects, e.g. WPPs) of free		

		access to information and implementation of a uniform information collection system with specific protocols for the recording of incidents of collisions and collection of dead animals by the forestry services.	
	Assessment of mortality due to electrocution and impact on electricity generation and transmission infrastructure	Mapping and assessment of the effects of electrocution and impact (and their cumulative effects) on power generation and transmission infrastructure in relation to the flight behavior and biology of vultures	
		Application of techniques to reduce mortality due to electrocution or collision with W/T or power cables (poles insulation, undergrounding of cables and/or use of twisted insulated wires, marking of cables, selective W/T disconnection).	
	Reduction of vulture mortality due to collision with power generation infrastructure	Integration of sensitivity maps in the new spatial plan for RES for proper zoning generation infrastructure and electricity production and transmission	
		Implementation of mitigation measures in WPPs where at least one vulture collision incident has been recorded. Mandatory introduction of a condition in the AETCs (Approvals of Environmental Terms and Conditions) to implement an immediate shutdown system, in line with best international practice, which includes the employment of field ornithologists on a permanent basis to alert in case of approach of vultures - raptors (<i>Aquila</i> spp., <i>Haliaeetus albicilla</i> , <i>Clanga</i> spp.); and shutdown of W/Ts based on a specific protocol. Permanent cessation of wind turbines in the event of repeated incidents of collision and whereas mitigation measures have not been effective	Electrocution & Impact on man-made structures & infrastructure.

	Zero mortality due to poaching	Increased patrols in areas with recorded cases of poaching of Vultures/Raptors	Direct pursuit/killing by man
	Minimization of illegal trade and trafficking of vulture samples	Recording of illegal trafficking incidents and investigation of e-commerce (embalmed vultures, live specimens, eggs) and assessment of the problem / Cooperation with the Cybercrime Unit for criminal prosecution	Trade and Embalming
	Zero drowning mortality in artificial reservoirs	Mapping of dangerous reservoirs in island and continental areas/Development of guidelines for safe construction for wildlife in artificial water bodies	Other causes
	Optimisation of artificial feeding practices	Elaboration of technical and sanitary specifications for the establishment and operation of Raptors' Supplementary Feeding Stations (RSFS) at a national level / Proposed siting with assessment of existing food abundance and availability in vulture distribution zones and assessment of potential feeding of regional RSFSs in critical areas for vulture conservation	Food insufficiency
		Establishment and operation of a network of RSFSs at a regional level, with the development of cooperation between public services, Protected Area Management Bodies, and their successor Protected Area Management Units of Natural Environment & Climate Change Agency (NECCA), NGOs and social partners (e.g. producers) in optimizing the disposal of the dead biomass produced in RSFSs / Promotion of cross-border cooperation in border areas and their parallel monitoring with simultaneous counts	
	Optimisation of artificial feeding practices	Monitor the use of RSFSs and study the behavior of scavenging species for potential negative effects of their operation (e.g. interspecific competition, low	Food insufficiency

		juvenile distribution, etc.) and the interactions between pets (dog) and vulture populations and the risk of transmission of zoonoses through the operation of RSFSs	
	Adaptation to European directives/regulations on the disposal of dead animals in the field	Harmonization with Union legislation and development of the appropriate legislative framework for the implementation of EU regulations on the free disposal of dead animals within the SPAs.	
		Promotion (informational campaign, introduction of incentives such as the exemption of the payment of a fee for the collection of dead animals for compulsory cremation) of all traditional vulture-friendly practices for the disposal of dead animals and their institutionalisation within SPAs at local level	
		Pilot planning and operation of small, scattered feed depots, cooperation with livestock farms, transport of dead animals, informing	
	Promotion of traditional/extensive forms of livestock farming	Promotion of agri-environmental policies for the development of extensive/nomadic livestock farming (implementation of union regulations, sustainable management of mountain pastures, management plans for grazing/improvement of products from free range animals)	
	Increase in genetic diversity of vulture populations and reduction of the effects of inbreeding	Renewal and updating of the legislative framework for the licensing and operation of Care Centres and the establishment of breeding programs in captivity in their facilities by Ministries of Environment and Energy/Rural Development and Food.	Small population size - Low genetic diversity
		Establishment and institutionalization of a supervisory authority at the Ministries of Environment and Energy/Rural Development and Food (along the CITES Committee lines) with specific	

		responsibilities in enrichment programs with the coordination of the Ministry of Environment and Energy and the cooperation of public bodies and NGOs/ Development of memoranda of understanding between the Supervisory Authority, Protected Area Management Bodies and Conservation Centers	
		Support and participation/cooperation with existing European captive breeding programs (EASA, LIFE, breeding centers, etc.)	
	Restoration of the vulture population locally by repopulating critical areas	Establishment and support of appropriate infrastructure per region for state-supervised vulture reintegration and empowerment programs (e.g. acclimatization cages, vulture maintenance) in SPAs and protected areas with their management bodies with small or isolated vulture populations/ Release of individuals from Care Centers in Greece	
	Facilitation of communication and linking of vulture metapopulations	Develop telemetry and individual ringing programs to identify feeding and distribution areas of juveniles and combine the data with mapping of critical vulture conservation priority areas.	Small population size - Low genetic diversity
		Establishment of "connectivity corridors" between vulture metapopulations by managing foraging habitat and siting and operation of RSFSs.	
	Increase of the reproductive success of populations	Delineation of sensitivity zones near colonies and nesting territories/ Proposals to adopt HRM (Human Resources Management) regulations and restrictions (spatial and temporal) on human activities (climbing, aerial flying, hunting, logging, rock lighting, etc.) in the vicinity of vulture critical areas	Disturbance at breeding sites
		Promotion of silvicultural management in selected forest stands / maintenance and increase of suitable nesting	Destruction of breeding habitat

		sites for Cinereus Vulture / reduction of accumulated biomass in selected stands by mechanical means, cutting and crushing / dispersal of riparian and shrub vegetation to shield Cinereus Vulture nesting sites	
		Maintenance of vulture accessibility to natural water bodies and streams by halting horizontal spread of forest in small areas along streams.	
		Implementation/application of other specific protection/management measures for Cinereus Vulture in accordance with the Joint Ministerial Decision 35633/13-10-2006, the 10-year Special Management Plan for Zone A of the Forest of Dadia National Park that is already being implemented and the proposed actions of the Special Environmental Study of the area	
	Increasing the viability and productivity of the vulture breeding population	Construction of suitable water reservoirs (including the installation of metal structures where there is no other option) for use by vultures during periods of maximum water shortage in critical island areas.	Degradation of foraging habitat
	Improving our knowledge on the distribution and population status of vultures	Establishment and updating of the National Database on Vultures regarding their distribution and population status / simultaneous recording of all mortality events	Gaps in knowledge on distribution, status, productivity, and mortality of vultures in Greece
		Establishment of a uniform, standardized protocol for fieldwork to record and monitor vulture populations	

		Implementation of a national vulture census programme (3 times in 6 years, to assess population trends) - Mapping of all active and historical colonies / Annual fieldwork in selected colonies/ territories and assessment of vulture breeding success	
	Improving our knowledge on the effects of lead use on vulture populations	Application of direct and reliable techniques for the detection of molybdenum in laboratory analyses (in certified public laboratories); / Lead sampling in scavenging predators in care centers; / Quantification of the incidence of lead poisoning in vulture populations through sampling.	Lack of knowledge about the level of exposure of vultures to toxic substances and the degree of their bioaccumulation
		Research on infectious disease mortality/development and implementation of a biomedical protocol for the collection and preservation of dead scavenging birds of prey	
	Evaluation/assessment of the cumulative impact of the operation of the WPP on vulture populations.	An assessment study to evaluate the cumulative impacts of operational and under development WPPs (habitat degradation/ displacement/impact on vulture populations) on vulture populations.	Lack of assessment of the cumulative impact of electrocution and energy infrastructure impacts on vulture populations.
	Development of a species recovery plan on a national or regional scale	Feasibility study for the enhancement of the natural populations of vultures in Greece/ Preparation of a release plan release strategy on a national or regional scale.	Lack of a restoration plan vulture populations for reintroduction or enrichment.
		Development of models of habitat suitability and potential spread of vultures (habitat suitability)	
	Increasing the viability and productivity of the vulture breeding population	Rationalization of the criminal framework for dealing with the problem	Mortality due to exposure to toxic substances.
		Promotion of legislation to ban the use of lead and lead-based paint reducing the risks	

		of lead exposure to wildlife and public health / Extend the implementation of the Joint Ministerial Decision on the prohibition of lead pits in wetlands throughout the country.	
		Promotion of legislation to reduce the use of dangerous NSAIDs in wildlife from the veterinary market	
		Implementation of legislation on environmental liability/damage in cases of vulture killing (addressing complaints, speeding up procedures, investigating incidents, penalties)	Mortality due to electrocution or impact with infrastructure
		Establishment and legal consolidation of the WPP operation for scavenging species at a national level. Necessity for institutionalisation of a study for RSFS specifications	Food insufficiency
	Integration of the National Action Plan into regional policies	Integration of provisions of the vulture conservation action plan into the management plans of protected areas and monitoring	Lack of integration of vulture conservation in the national environmental policy.
		Monitoring and evaluation of the implementation of the action plan	
	Prioritizing conservation of vultures in the daily agenda of responsibilities/ actions of public services	Conduct at least 4 local seminars for the employees of the forestry and veterinary services, the environmental sectors of the regions, the gamekeepers of hunting organizations and the supervisors of the Protected Area Management Bodies (PAMBs) on issues related to the management of vulture populations (population monitoring methods, management tools, vulture ecosystem services, illegal use of poison baits, administrative issues regarding the implementation of infrastructure mitigation techniques	1. Low priority in the implementation of vulture conservation actions by the responsible public agencies 2. Electrocution & Impact on man-made structures & infrastructure 3. Lack of information/training of the competent public services in vulture conservation actions in Greece

Reduction of negative impact of human activities on vulture populations	Awareness-raising/sensitization of land users and stakeholders (farmers, beekeepers, hunters, tourism operators, etc.) and the general public in areas critical for vultures on issues related to the management of their populations (ecosystem services provided by vultures, effects of the use of poisoned baits, alternative methods of mitigating and controlling damage to livestock by carnivorous mammals, etc.)/provision of information material on the conservation and ecological value of vultures.	Lack of information to stakeholders/land users on the conservation status and threats to vultures.
Dissemination of information on the need to preserve the vulture population	Special topics on the ecological value and the need for conservation of vultures in the Information Centres of the Management Agencies (Protected Areas where vulture species occur).	Low dissemination of information regarding the conservation of vultures in Greece.

Measures and actions in line with the objectives of the National Action Plan for the three scavenging species of ornithofauna (vultures): vulture (Gypaetus barbatus), hornet (Gyps Fulvus), black vulture (Aegypius monachus).

Parameters	Target	Measures/Actions
Population preservation	Reducing the risk of poisoning due to the illegal use of poison baits	Intensification of patrols/controls Recording of poisoning incidents and creation of risk maps Provision of electric fencing to land users operating within the areas where the Egyptian vulture occurs
	Reducing the risk of collision with wind turbines	Creation of risk sensitivity maps and exclusion zones from wind turbines around nests and roosting sites
	Reducing the risk of electric shock and collision with power transmission and distribution network cables	Insulation of dangerous pylons and marking of electricity cables around nests, roosting sites, and migratory constrictions
	Increased availability of food	Establishment and operation of a network of feeding areas for birds of prey (FAOB)
	Reduction of disturbance during nesting	Establishment of protection zones around nests

			Seasonal (March-September) exemption for sports & activities through IACS
			Ban on lighting of cliffs with Meteora nests
	Improvement monitoring and research of population Egyptian Vulture in Greece	Systematic Monitoring	Monitoring using standardized protocol. monitoring
		Research on the Mortality Research	Bird ringing
			Chick telemetry and where appropriate and where feasible adult individuals and spatial mapping of habitat use. and migration routes
			Creation and implementation of a biomedical protocol of dead birds
		Study of the viability of the species	Development of suitability models habitat suitability/species distribution
			Development of analysis models Population Viability Analysis (PSA)
		Evaluation of the risk assessment of the bioaccumulation of lead in the food chain	Lead sampling tests. on large birds of prey in the centers care centres
		Research on the strengthening the Population	Feasibility study for reintroduction-enhancement of the natural population in Greece
	Legislation and Politics	Reducing the risk of poisoning due to the illegal use of poisoned baits.	Elaboration of the project "National Action Plan for Poisoned Food Lures"
		Reduction of risk poisoning.	Use of alternatives to diclofenac with comparable results, which proven not to harm scavenging birds.
	Communication and education	Training of stakeholders to improve the response to poisoned bait incidents	Conducting information and training seminars for officials of the Forestry Services, the environmental sectors of the regions, game wardens of hunting organizations and supervisors of protected area management bodies.

			Conducting training seminars for the employees of the Veterinary Services
		Information and awareness-raising of interest groups.	Awareness of land users (farmers, hunters, beekeepers) for the protection of the Egyptian Vulture and the problem of poisoned baits
			Raising awareness of development stakeholders in sensitive breeding areas by providing them with information on the protection of vultures
		Public information	Public information and awareness campaign on poisons in the application areas
			Provision of Programme information material to target locations.

Measures and targets of the National Action Plan for the Egyptian Vulture Joint Ministerial Decision 43236/1053/3760B/25.10.2017.

Following the approval of the 2021 Action Plan for scavengers, a report was published in January 2023 by the Hellenic Ornithological Society entitled "Identification of critical habitats (mapping of sensitivity) of the Vulture in Greece Determination of management guidelines" in the framework of the implementation of action C.1 "Pilot implementation of Action Plans for species and habitat types" of the project "LIFE-IP 4 NATURA.

The report lists some measures to mitigate the impacts of the various threats to the *Ornithus* species, but the measures are proposed and have not yet been adopted.

From the Joint Ministerial Decision 68086/2149/2021 and the Joint Ministerial Decision 43236/1053/(Government Gazette 3760B/) 25.10.2017), measures have been proposed to address the impacts of the (wind turbines) W/T on endangered species which are partly in line with the proposed measures of the existing Environmental Impact Assessment and the Special Ecological Assessment. However, no exclusion zones and/or sensitivity zones have yet been established as the Ministerial Decision in question refers to their inclusion in the Renewable Energy Land Use Plan under review, while references to post-construction monitoring of the wind farms project with protocols for recording collision incidents and recovery of dead animals.

It is also important to note that the consultation of the Special Environmental Study of the Evros and Rhodope Region has been completed.

According to Article 47 of Law 4685/2020, the Special Environmental Study is the "scientific study to document the Presidential Decree of one or more protected areas and the Management Plan of each protected area". In particular, it focuses on the characterization of protected areas, the zones defined within them, the necessity

	<p>or not of establishing regional zones, ecological corridors, as well as the proposal for the regulation of activities and functions and the provision of appropriate measures and actions for the preservation of the protected object of each protected area, which, however, must first be established in order to be implemented as such. However, Management Plans have not been prepared and therefore no relevant Legislative Decree (e.g., Presidential Decree) has been adopted.</p> <p>Considering the above data, the field observations of the Special Ecological Assessment (July 2020 - June 2021) and the conditions for the implementation of all the mitigation measures mentioned in detail above, it is estimated that the project under consideration.</p> <ul style="list-style-type: none"> ✚ is not likely to cause delay or interrupt the progress in achieving the conservation objectives of the Natura 2000 sites concerned. ✚ Not likely to impede the achievement or maintenance of the objectives for the bird species of par. 1 and 2 of Article 4 of Directive 2009/147/EC on ✚ Special Protection Areas (SPAs) of the national ecological network under consideration ✚ NATURA 2 000 of Greece were established by the Decision of the Deputy Minister of Environment and Energy No. 50146/1786 (Government Gazette 3118/B/10-05-2023). ✚ It is not likely to reduce the area or fragment habitat types of Natura 2000 sites or affect the representativeness and degree of conservation of their structure and functions. ✚ It is not likely to reduce the size of the population of species or affect the degree of conservation of their habitats or fragment them or affect the balance between species or affect the degree of isolation. ✚ Not likely to cause changes to vital parameters (e.g. nutrient balance, soil degradation from potential erosion, dynamics of relationships between biotic and abiotic parameters) that determine how Natura 2000 home sites function. ✚ Not likely to have interactions with predicted or expected natural changes in Natura 2000 residential sites.
